

UDF Examples Rule Application Notes

Overview

This rule application is designed to show some good examples of a variety of different User Defined Functions (UDFs). The UDFs are grouped into 5 different function types.

Each UDF has comments within it to describe the functionality and provide any additional notes.

Function

IrScript:

```
1 // Returns true if all of the fields on the entity are valid, and false if any are invalid.
2
3 for (var field in Context.Entity.Fields){
4     if (field.IsValid== false)
5         return false;
6 }
7 return true;
8
9
```

Rules

There is not a cohesive “rule story” here. A rule exists to test each specific User Defined Function. The rules are grouped in the same groupings as the UDFs and are in the same order.

Each rule name matches the UDF name, with a suffix of “Test”.

These rules give examples of how to call each of these UDFs from rules.
